2 Literature Review

Here is the title of this slides

- Studies investigating the impact of Rocky's little brother's birth on his instances of running away.

3 Method

[label=Rocky]There you can also separate the page Now I am going back to the previous slidesby clicking this: go back

Econometric Model

$$y_i = \beta X_t + \gamma_i C_{it}$$

- y_t is Rocky's run away times in week t
- X_t is a dummy variable indicating the occurrence of the birth of his little brother, Vincent.

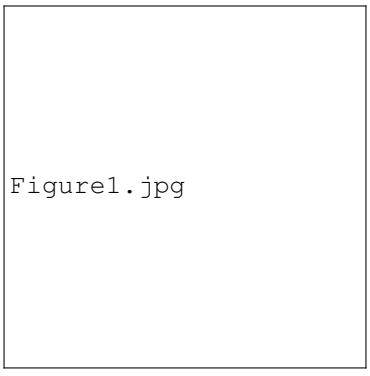

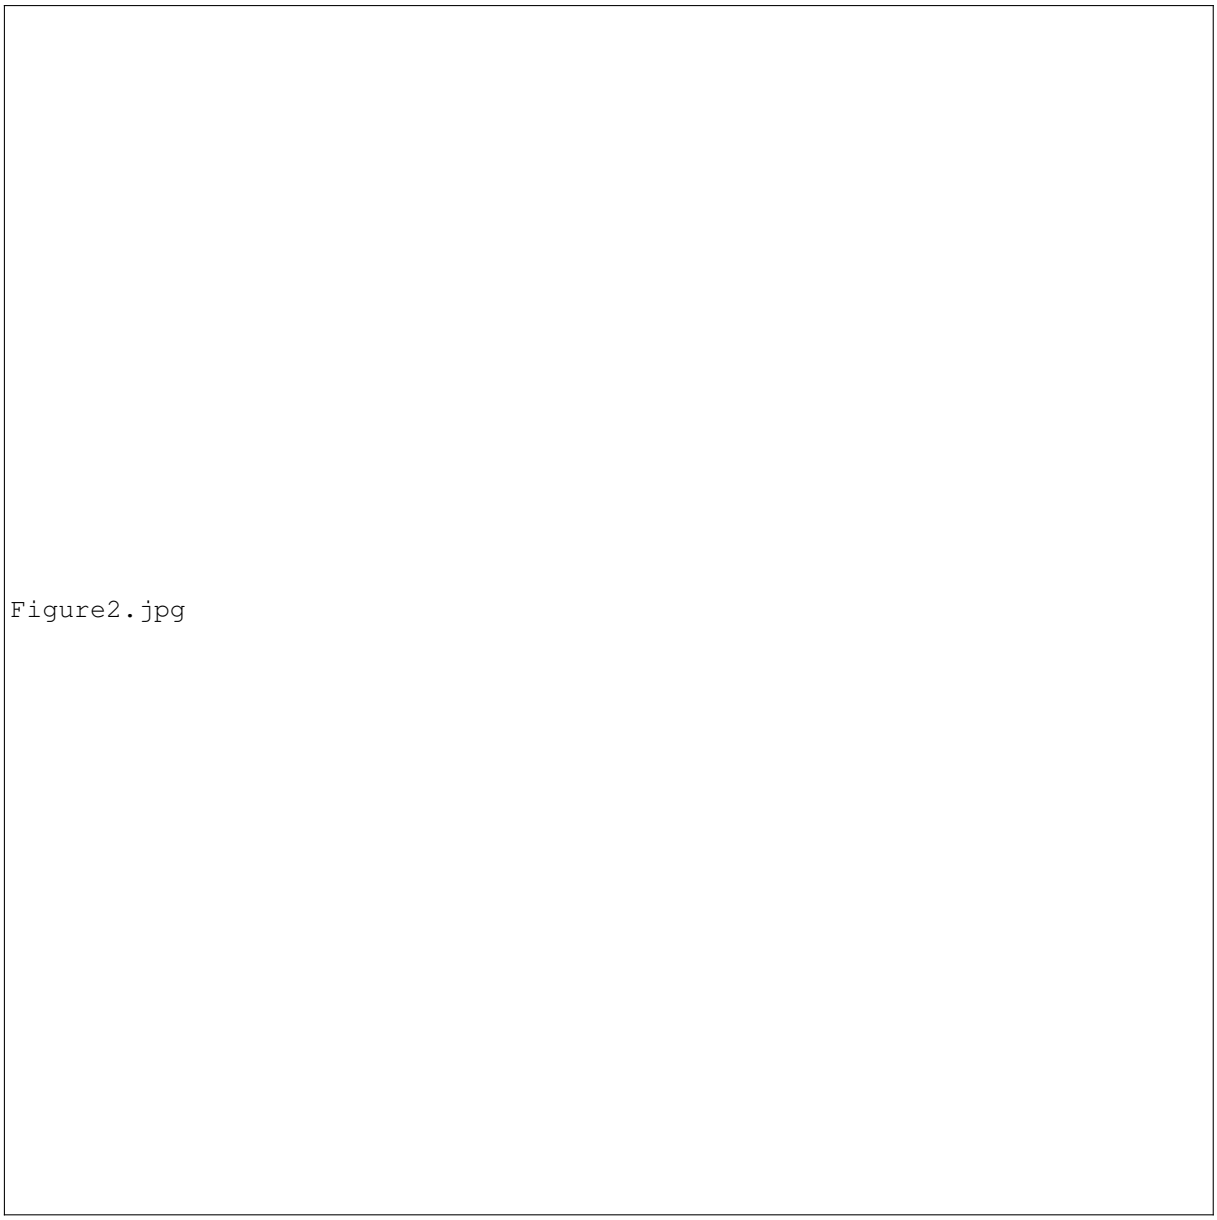

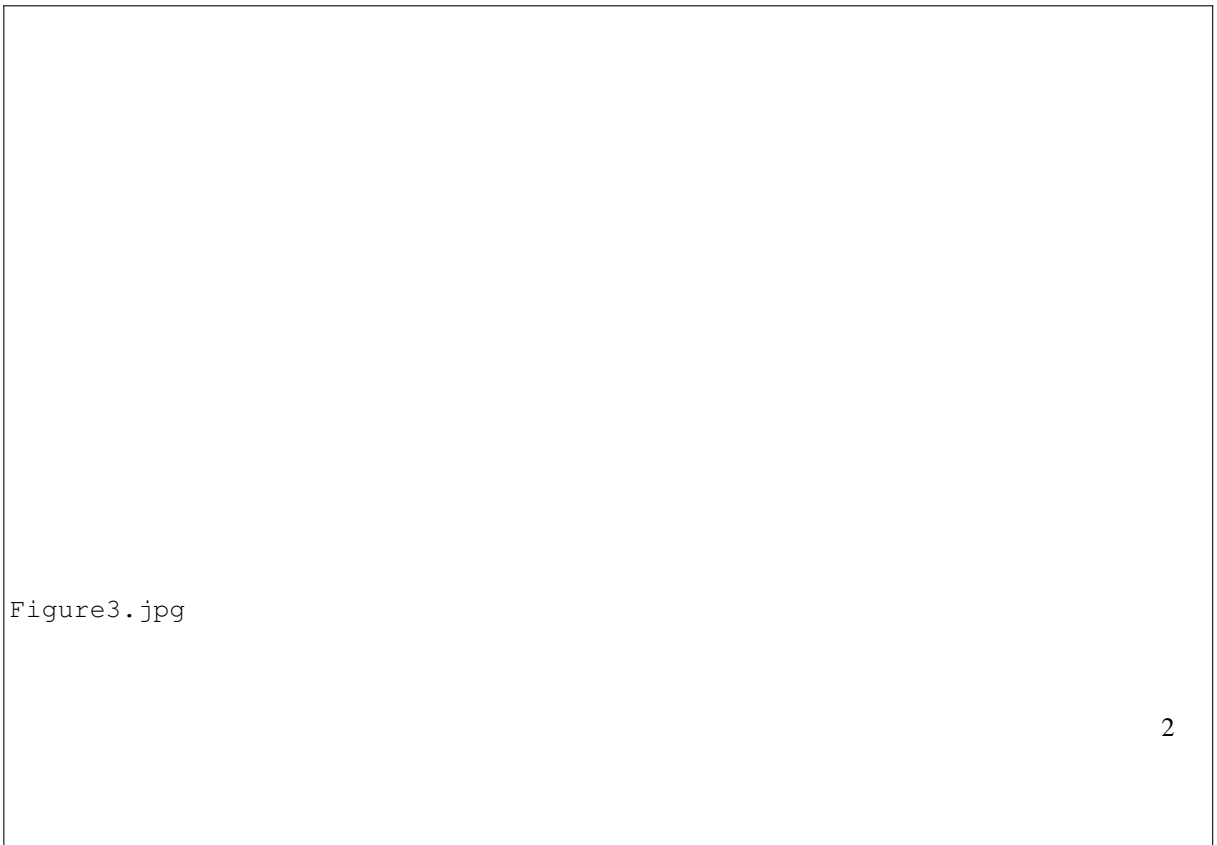

Figure 1: His name is Rocky

[c] 0.3

  - $X = 0$ is before his brother's birth (He is the single kid in his family)
  - $X = 1$ is after his brother's birth (2-child family)
- C_{it} is control variables, i.e. average weekly hiking distances; frequency of dog park; Rocky's food in time t

4 Data

Data Source His father's statistics

5 Results

Results

6 Conclusion

Conclusion

- Rocky was indeed incensed by the birth of his brother, leading to a significant increase in the number of escapes
- Rocky is a narrow-minded dog
