Length: 3-4 pages

Ringkasan

redYour abstract here (max 10-15 lines).

1 Introduction

red

- Introduce your research (context)
- Problem statement and research question, including concrete hypothesis

2 Related Work

redFind and discuss 1 paper that is relevant for your own project, discuss it in relation to your own work and cite properly. If you find additional papers, discuss them (optional).

redYou can cite a paper by using BibTeX like this Culotta:ea:2014, or the following way if the paper is part of the sentence like [**?**], where the BiBTeX entry is in the `mybib.bib` file. The proper use of LaTeX and citation using BiBteX is part of this assignment.

3 Data

redDescribe the data you used in your research. Describe the data collection, the way you obtained the part of the data you worked with (precisely describe how you obtained the data for your independent and dependent variables). You can provide a table of summary statistics to give the reader an idea of the dataset you are using. For example, "We constructed ..."[1]

redDescribe how you obtained data for your variables. If it relies on an automatic way to inferring the variable (e.g., for gender) describe precisely how you did it. Mention also possible limitations of the way you obtained the data. (bonus: if you work with gender you can manually check 100 users to analyze how correct your automatic way of obtaining gender information is).

Pre-processing redDescribe how you pre-processed the data. Describe all design choices (e.g., did you tokenize the data? how did you handle retweets?). Provide a link to your github repository with all code to reproduce the results.

Table **??** provides a summary of the data used in this study. redShow a couple of examples from your actual dataset.

A	B
A	B
A	B

Tabel 1: Overview of the data set. Provide an appropriate caption.

4 Analysis and Results

redThis is the part in which your analysis goes, were you discuss your methods and results. Give an overview of your results and discuss them. Did you expect this results? Why (not)? Usually this is the part were you provide tables with results, and in the text you describe the results. For example, "This section discusses the method used in this study, a quantitative analysis of ..."

Results Table **??** summarizes...

redBonus: perform a hypothesis test to see if the result is significant. You might also reflect briefly on why it is important to carry out such a hypothesis test.

A	B	C
A	B	C
A	B	C

Tabel 2: Add a caption

[1] red[Note: use 'we' rather than 'I', even though you are the only author (this work is individually done!) - this is common practice in many fields]

5 Conclusion

redWrap up your report by giving answers to your research question in the beginning. For example, “This study aimed at ..." You might mention limitations of the current study, or directions for further research here.

redCheck list

red(in your final paper remove this section) red

- Make sure your paper is max 4 pages long
- check that your paper contains an abstract
- check that your paper states the research hypothesis clearly, and defines independent and dependent variables
- make sure your paper has a related work section were you discuss at least 1 paper that you found relevant to your own work
- check that your paper describes precisely how you created the data set that you base your research on, including all steps in preprocessing the data
- include an overview of the collected data (optionally: show a few examples of the actual data that are used in your study)
- make sure your paper links to the github repository and that contains all scripts to obtain your results
- make sure your paper contains an analysis and results section, which shows the results of your study and discusses them (table + text)
- finally, make sure you have all parts of the report: abstract, introduction, related work, data, analysis and results, conclusion
- check proper use of LaTeX and BibTex
