Types of Graph I

[Complete Graph,width = 8cm]whitedeepmagenta A graph in which every pair of distinct nodes is connected by an edge [Forest,width = 0.86]whitearsenic A collection of trees or disjoint tree-like structures within a graph [Tree,width = 0.9]whiteblue A special case of an acyclic graph in which there is a single root node, and every other node is connected by exactly one edge.

[Undirected Graph,width = 6cm]blackaqua A graph in which edges do not have any direction.

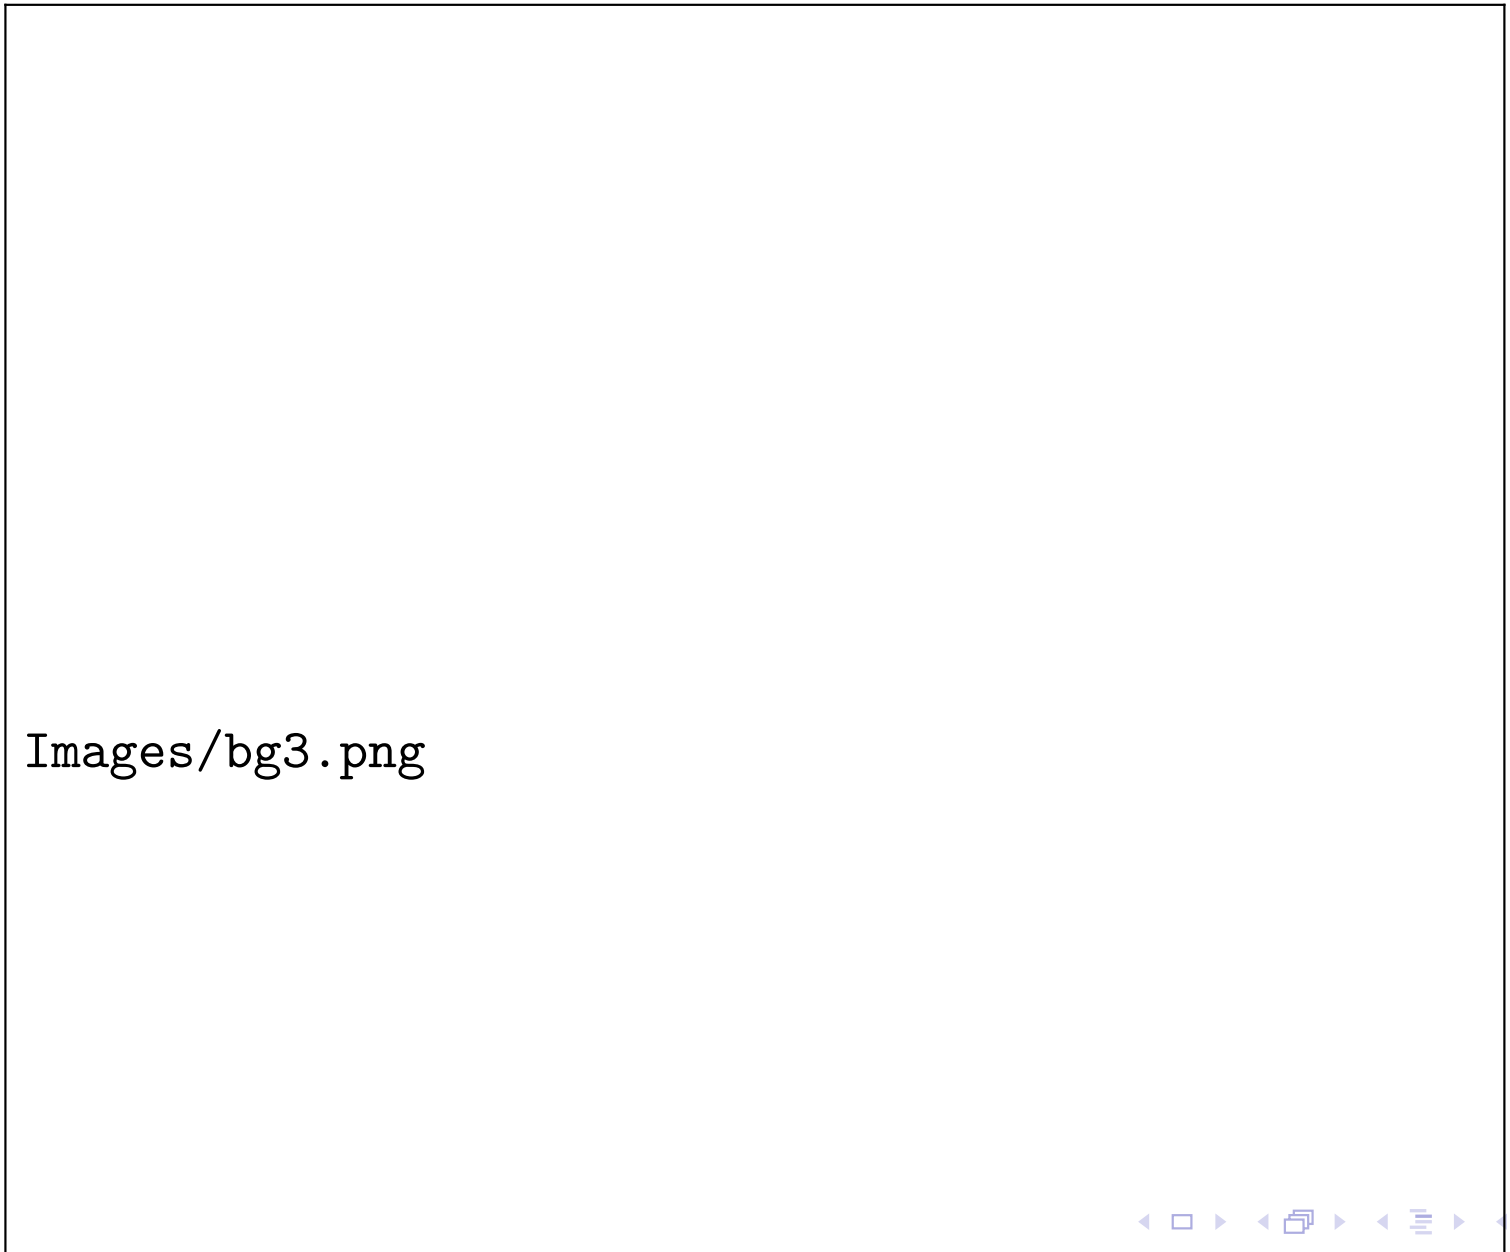

[Directed Graph,width = 6cm]arsenicaqua A graph in which edge has direction.

- A Graph is a non-linear data structure consisting of vertices and edges.
- The **Vertices** are sometimes also referred to as nodes and the **Edges** are lines or arcs that connect any two nodes in the graph.

  [More formally]whitearsenic A Graph is composed of a set of vertices V and a set of edges E.
  The graph is denoted by **G(V,E)**.
- Graph data structures are a powerful tool for representing and analyzing complex relationships between objects or entities.
- They are particularly useful in fields such as social network analysis, recommendation systems, and computer networks.
- In the field of sports data science, graph data structures can be used to analyze and understand the dynamics of team performance and player interactions on the field.
