This template is a based on https://www.overleaf.com/latex/templates/sintef-presentation/jhbhdffczpnxSINTEF Presentation from mailto:federico.zenith@sintef.noFederico Zenith and its derivation https://github.com/TOB-KNPOB/Beamer-LaTeX-ThemesBeamer-LaTeX-Themes from Liu Qilong

In the following you find a brief introduction on how to use LaTeX and the beamer package to prepare slides, based on the one written by mailto:federico.zenith@sintef.noFederico Zenith for https://www.overleaf.com/latex/templates/sintef-presentation/jhbhdffczpnxSINTEF Presentation

1 Introduction

Beamer for SINTEF slides

- We assume you can use LaTeX; if you cannot, http://en.wikibooks.org/wiki/LaTeX/you can learn it here
- Beamer is one of the most popular and powerful document classes for presentations in LaTeX
- Beamer has also a detailed http://www.ctan.org/tex-archive/macros/latex/contrib/beamer/doc/beameruserguide.pdfuser manual
- Here we will present only the most basic features to get you up to speed

Beamer vs. PowerPoint Compared to PowerPoint, using LaTeX is better because:

- It is not What-You-See-Is-What-You-Get, but What-You-*Mean*-Is-What-You-Get: you write the content, the computer does the typesetting
- Produces a `pdf`: no problems with fonts, formulas, program versions
- Easier to keep consistent style, fonts, highlighting, etc.
- Math typesetting in TeX is the best:

$$\mathrm{i}\,\hbar\frac{\partial}{\partial t}\Psi(\mathbf{r},t) = -\frac{\hbar^2}{2\,m}\nabla^2\Psi(\mathbf{r},t) + V(\mathbf{r})\Psi(\mathbf{r},t)$$

[fragile]Getting Started Selecting the SINTEF Theme To start working with `sintefbeamer`, start a LaTeX document with the preamble: Minimum SINTEF Beamer Document

```
\documentclass{beamer}
\usetheme{sintef}
\begin{document}
\begin{frame}{Hello, world!}
\end{frame}
```
