1 Normal section

This is how you normally work with LaTeX, but you can also split a project into smaller files for easier management. To import other files, you can use latex or latex. There differences can be found at `https://tex.stackexchange.com/a/250`, but in short

latex = latex

2 Label prefixes

There are no definite rules for label prefixes, but you can use the following as a guideline.

- **chap:** for chapters
- **sec:** for sections
- **subsec:** for subsections
- **eq:** for equations
- **fig:** for figures
- **tab:** for tables
- **enum:** for enumerators and items
- **fn:** for footnotes
- **lst:** for listings
- **alg:** for algorithms
- **app:** for appendices

The latex
macro increases the used counter and sets the current label text which is used by latex
. If you use latex
before it the old label text is used instead, which leads to a wrong number. Always use latex
after latex
and not before or in it.
That said, conventions are just conventions, and you can use whatever you want as long as you are consistent.
