[plain, noframenumbering]Outline

1 Aspect ratio

[fragile]Aspect ratio This pdf uses a 16:9 aspect ratio. To utilize this version, simply use:

```
\documentclass[aspectratio=169]{beamer}
```

The default is a 4:3 aspect ratio.

```
\documentclass{beamer}
```

2 vfilleditems

[fragile]Using vfilleditems

```
Use the provided \vfilleditems environment
to create nicely spaced bullet points.

\begin{vfilleditems}
  \item I like it to have my bullet points
  \item evenly spaced from one another
  \item then few bullet points, are not crammed on
  the upper part of the slide
\end{vfilleditems}
```

Using vfilleditems

I like it to have my bullet points

evenly spaced from one another

then few bullet points, are not crammed on the upper part of the slide

3 Fonts

[fragile]Fonts Fonts:

This is small

This is normal size

This is large

Per default the *Fira Font* Package is used. The *Helvetica Font* is also bundled into this package.

[fragile]Fonts To use *Helvetica* instead of *Fira Fonts*

```
\usetheme[helvetica]{pureminimalistic}
```

To disable the *Fira Fonts* and use the default font

```
\usetheme[nofirafonts]{pureminimalistic}
```

4 Color

[fragile]Color To overwrite the theme color

1. Define a new color
2. redefine the themes color (before document begins)

[fragile]Change color example

```
\usetheme{pureminimalistic}
\definecolor{textcolor}{RGB}{0, 0, 120}
\definecolor{title}{RGB}{0, 0, 0}
\definecolor{footercolor}{RGB}{133, 133, 133}
\definecolor{bg}{RGB}{25, 116, 210}

\renewcommand{\beamertextcolor}{textcolor}
\renewcommand{\beamerbgcolor}{bg}
\renewcommand{\beamerfootertextcolor}{footercolor}
\renewcommand{\beamertitlecolor}{title}
```

[fragile]Dark mode I've included a simple way to use a dark mode color theme. To use the dark color mode, provide the `darkmode` option.

```
\usetheme[darkmode]{pureminimalistic}
```

Sometimes, the logos have to be changed to look nice on a dark background. For now, I am simply loading different files if `darkmode` is used.

5 Graphics

Logos Commands setting the logos:

`\logotitle` – Command used for the title page. Here `\linewidth` corresponds to the entire paper width.

`\logoheader` – Command used for the header. Here `\linewidth` corresponds to a smaller box, as the horizontal space is shared with the title.

`\logofooter` – Command used for the footer. Here `\linewidth` corresponds to a smaller box, as the horizontal space is shared with the footer text.

[fragile]Logos – Load own logo To use your own logos, simply redefine the commands and adjust the sizes.

```
\renewcommand{\logotitle}{\includegraphics%
  [width=.2\linewidth]{alternative_logo/gameboy.png}}
\renewcommand{\logoheader}{\includegraphics%
  [width=.5\linewidth]{alternative_logo/gameboy.png}}
\renewcommand{\logofooter}{\includegraphics%
  [width=.15\linewidth]{alternative_logo/console.png}}
```

[fragile]Logos – Disable logo To disable the logo, overwrite the default logo command with an empty command.

```
\renewcommand{\logofooter}{}
```

Figures I also changed the default caption settings to not include `Figure:` and reduced the font size.

[T] .3

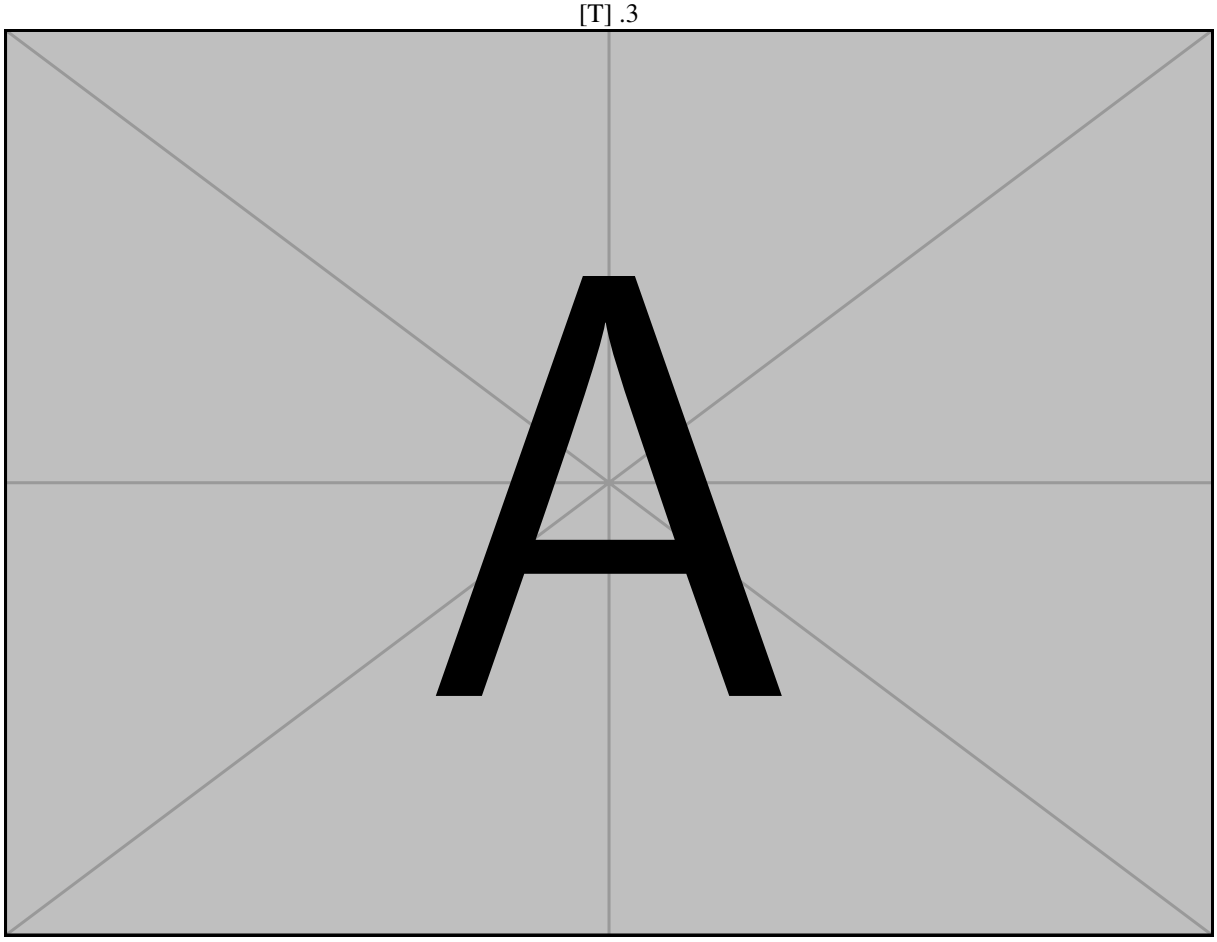

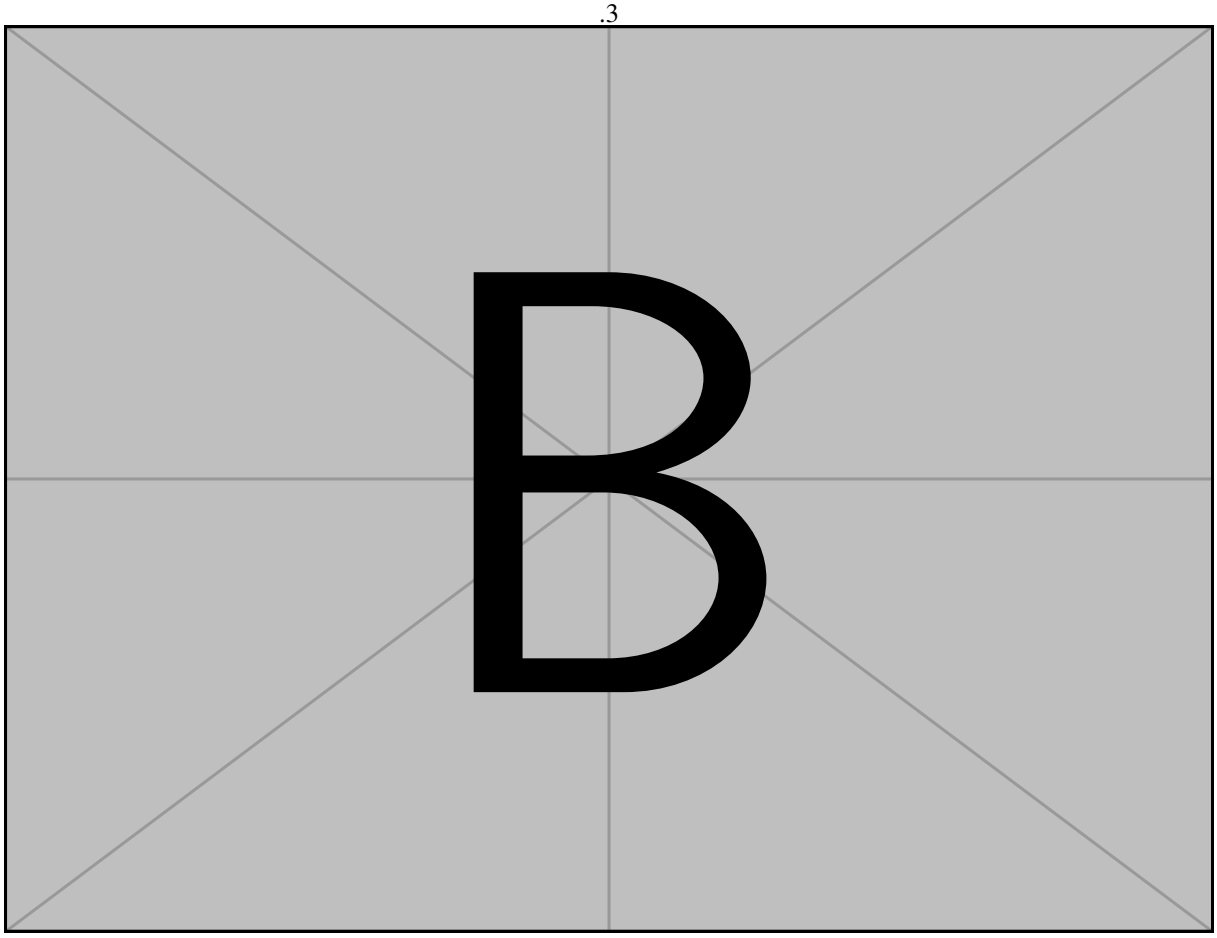

Figure 1: Example A

4

Figure 2: Example B

[fragile]Figures – Set background watermark There is no extra option to define a background watermark, but here is a command that could be used to create one manually:

```
\setbeamertemplate{background}{%
  \tikz[overlay,remember picture]%
  \node[opacity=0.8]at (current page.center)%
  {\includegraphics[width=.2\linewidth]%
  {example-image-a}};%
}
```

background[overlay,remember picture][opacity=0.8]at (current page.center) 

; Figures – Set background wa
Usually you would add this command to specific frames by enclosing this command and all desired frames with curly brackets.

See the source code of this **.tex* file for an example.

6 Footer options

[fragile]Disable footer If you do not want to use a footer, disable it with:

```
\usetheme[nofooter]{pureminimalistic}
```

[fragile]Show max slide numbers For these slides, I used the option to show the maximum number of slides. To activate it one has to activate it with:

```
\usetheme[showmaxslides]{pureminimalistic}
```

Usually, I prefer to not show the maximum number of slides, as the people tend to lose focus if they know the last few slides are shown.

7 Citations

Citations I've also changed the bibliography options to be minimalistic:
Just showing a simple `\cite` **[?]**

Backup Slides

[plain, noframenumbering]

Backup Slides

What happened to the page numbering?

I've used the `appendixnumberbeamer` package, which resets the frame counting after calling `\appendix`

Depending on the used pdf viewer, the total count of frames shouldn't include the backup slides and won't demotivate the audience.

Usually, I would use a `plain` frame for the backup slides.
