(Note: blue This is a template for how to manage long documents in Latex and it combines goodies from few different libraries to support writing long documents. It was developed for the purposes of writing a thesis. It includes example glossary, watermark, line numbers, appendices, references with bibtex, custom command and example sections. In this template every chapter/section has its own file (e.g. 0-abstract.tex, 1-introduction.tex, etc...) and is referenced from the main file (main.tex) which should be compiled to get the final document. This structure is useful for writing separate chapters without the need to compile the rest of the document and in the same time preserving the possibility to do so from the main file. Example reference to the glossary, e.g.: semantic$_s egmentation; andtotheacronyme.g. : gps(seethesourcecode)$)
