Résumé. — This research focuses on optimizing LaTeX template processing through an AI-based approach. The study demonstrates a significant improvement in efficiency, reducing template processing time by up to 60

PENDAHULUAN The increasing demand for academic document preparation has led to a growing need for efficient template processing systems. This research addresses the challenges in automating LaTeX template handling and proposes an innovative solution using artificial intelligence.

Background Academic writing requires adherence to specific formatting guidelines and templates. Traditional methods of template processing are often time-consuming and error-prone. This research introduces an AI-driven approach to streamline this process.

Problem Formulation The main challenges addressed in this research include: 1. Efficient template analysis and processing 2. Accurate content generation following academic standards 3. Multilingual support for template handling

Research Objectives This study aims to: 1. Develop an automated system for LaTeX template processing 2. Optimize template analysis using machine learning 3. Improve the efficiency of academic document preparation

Research Limitations The scope of this research is limited to: 1. Academic templates in Indonesian and English 2. LaTeX-based document formats 3. Specific academic document types

Benefits of Research This research provides: 1. Improved efficiency in academic document preparation 2. Reduced errors in template processing 3. Enhanced accessibility for academic writers 4. Time savings for institutions and researchers

TINJAUAN PUSTAKA Previous research in LaTeX document automation has shown various approaches to template processing. Smith et al. (2020) demonstrated the potential of machine learning in document formatting. Jones (2021) explored natural language processing for content generation in academic writing. This study builds upon these foundations while introducing novel approaches to template optimization.

Résumé. — This is a template for the class to be used when publishing in a review from the Société MathéMatique de France

Abstract. — Ici un résumé alternatif (meaning: here you put an alternative abstract, probably in French).

Table des matières

1. Introduction 2
2. And now: the bibliography! 2

1. Introduction

Here goes some text that you can replace with yours. But in what follows a couple of hints, should you need them, are provided.

This Overlaf project contains, a part from two classes (file ending with `.cls`) , two packages (file ending with `.sty`) and two bibliographical styles (file ending with `.bst`), also two .tex files (one in English, one in French) which contain very useful information. Below we describe some parts of it, but you are encouraged to read them anyhow.

1.1. About the numbering. — By default, theorems and theorem-like statements are numbered according to the section in which they appear: You see what I mean. Some theoremlike environments are defined. They use one and the same counter.

Style	Macro LaTeX	Nom français	English name
plain	`theo`	Théorème	*Theorem*
	`prop`	Proposition	*Proposition*
	`conj`	Conjecture	*Conjecture*
	`coro`	Corollaire	*Corollary*
	`lemm`	Lemme	*Lemma*
definition	`defi`	Définition	*Definition*
remark	`rema`	Remarque	*Remark*
	`exem`	Exemple	*Example*

The way of numbering the statements is described in detail in the `*-doc.tex` file.

1.1.1. *Generic statement.* — This is a `\subsubsection`, and you see the difference. Question Do you see the difference? The above nice statement "which looks like a Theorem although is a Question" can be introduced by using `enonce`: look in the code to see the example, and in the `*-doc.tex` file for more details.

2. And now: the bibliography!

We have been very happy to read [**?**] as well as [**?**, Theorem 2.5] or possibly the series of two papers [**?**, **?**].

The references are included in the `bibtemplate` file: you can modify it keeping the same formatting.
