Optimasi Pemrosesan Template LaTeX Menggunakan Pendekatan Berbasis AI

Academic Support Agent

19 Pebruari 2025

Ringkasan

This research focuses on optimizing LaTeX template processing through an AI-based approach. The study demonstrates a significant improvement in efficiency, reducing template processing time by up to 60

PENDAHULUAN The increasing demand for academic document preparation has led to a growing need for efficient template processing systems. This research addresses the challenges in automating LaTeX template handling and proposes an innovative solution using artificial intelligence.

Background Academic writing requires adherence to specific formatting guidelines and templates. Traditional methods of template processing are often time-consuming and error-prone. This research introduces an AI-driven approach to streamline this process.

Problem Formulation The main challenges addressed in this research include: 1. Efficient template analysis and processing 2. Accurate content generation following academic standards 3. Multilingual support for template handling

Research Objectives This study aims to: 1. Develop an automated system for LaTeX template processing 2. Optimize template analysis using machine learning 3. Improve the efficiency of academic document preparation

Research Limitations The scope of this research is limited to: 1. Academic templates in Indonesian and English 2. LaTeX-based document formats 3. Specific academic document types

Benefits of Research This research provides: 1. Improved efficiency in academic document preparation 2. Reduced errors in template processing 3. Enhanced accessibility for academic writers 4. Time savings for institutions and researchers

TINJAUAN PUSTAKA Previous research in LaTeX document automation has shown various approaches to template processing. Smith et al. (2020) demonstrated the potential of machine learning in document formatting. Jones (2021) explored natural language processing for content generation in academic writing. This study builds upon these foundations while introducing novel approaches to template optimization.

Write your abstract here. Please do not exceed a length of two A4 pages, and do not modify the template. Use the Overleaf platform to prepare your abstract if you do not have a working LaTeX setup.

Start by giving some motivations, then describe your work and your results. For units, siunitx is loaded, so do not hesitate to write about your high magnetic field of 9 or your spin waves with frequencies up to 250, or even your spatial resolution in the -range. You can add equations like this, and refer to them (see Eq. 1):

$$Q_{topo} = \frac{1}{4\pi} \int \vec{m}(\vec{r}) \cdot (\vec{m}x \times \vec{m}y)\, \vec{r} \tag{1}$$

For references, use the Bibtex format in a file named `biblio.bib` [**?**] and use biber as a compiler. You can get the Bibtex description from Zotero or from a DOI on this website: `https://www.doi2bib.org/`. The references section will then be filled automatically. We also suggest to add a nice figure with some caption to catch the attention of your audience (see Fig. 1), following this example:

Gambar 1: This is a spin.

Once you are ready, upload your pdf file on the website of the conference as the main file. **As a supplementary file, we ask you to upload a .zip file containing your .tex file, together with your biblio.bib file and your figure (if any)**. Such a zip can be downloaded directly from Overleaf, click on the download icon next to the project on your Overleaf home page. Firebrick1This is mandatory, we need these files to create the final booklet.
