There Is No Largest Prime Number

Theorem and Proof

Theorem (Example)

There is no largest prime number.

Bukti.

The invertible elements in a field form a group under multiplication. In particular, the elements

$$1, 2, \ldots, p-1 \in \mathbb{Z}_p$$

form a group under multiplication modulo p. This is a group of order $p-1$. For $a \in \mathbb{Z}_p$ and $a \neq 0$ we thus get $a^{p-1} = 1 \in \mathbb{Z}_p$. The claim follows. □

The environments

Lemma, Proposition, Corrollary and Definition

Lemma (Title of lemma)

There is no largest prime number.

[Title of proposition] There is no largest prime number.
[Title of corrollary] There is no largest prime number.

Definition (Title of definition)

There is no largest prime number.

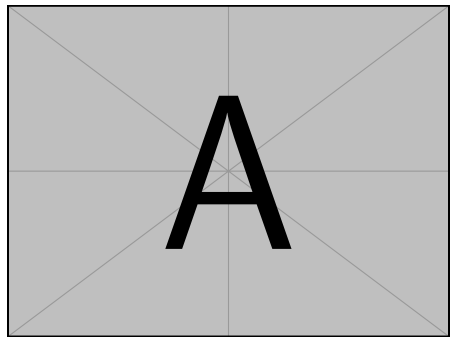

Enumerate environment

1. Suppose p were the largest prime number.
2. Let q be the product of the first p numbers.
3. Then $q + 1$ is not divisible by any of them.
4. But $q + 1$ is greater than 1, thus divisible by some prime number not in the first p numbers.

Itemize environment

- one
- two

Figure, example and alert block
