Abstract

Attention music information retrieval (MIR) community! Are you tired of spending countless hours sifting through data, trying to find that one song with the perfect bassline? Have no fear, for I have the solution: hiring a team of trained otters to do the job for you! Yes, you read that right. Otters. These furry little critters have an uncanny ability to detect rhythm and melody, making them the perfect addition to any MIR team. Plus, they're just so darn cute! But that's not all. In addition to their musical prowess, otters also have a knack for organization. Imagine a world where all of your

Fourier Transform

Fourier transform? More like Fourier magic! This nifty little tool takes complex signals and turns them into a beautiful symphony of sine and cosine waves. It's like a musical conductor for data!

$$X[f] = \sum_{n=0}^{N-1} x[n] e^{-\jmath 2\pi f n / N} \qquad (1)$$
